System Software

Compilers and operating systems constitute the basic interfaces between a programmer and the machine for which he is developing software. In this book we are concerned with the construction of the former. Our intent is to provide the reader with a firm theoretical basis for compiler construction and sound engineering principles for selecting alternate methods, implementing them, and integrating them into a reliable, economically viable product. The emphasis is upon a clean decomposition employing modules

that can be re-used for many compilers, separation of concerns to facilitate team programming, and flexibility to accommodate hardware and system constraints. A reader should be able to understand the questions he must ask when designing a compiler for language X on machine Y, what tradeoffs are possible, and what performance might be obtained. He should not feel that any part of the design rests on whim; each decision must be based upon specific, identifiable characteristics of the source and target languages or upon design goals of the compiler. The vast majority of computer

professionals will never write a compiler. Nevertheless, study of compiler technology provides important benefits for almost everyone in the field . • It focuses attention on the basic relationships between languages and machines. Understanding of these relationships eases the inevitable transitions to new hardware and programming languages and improves a person's ability to make appropriate tradeoffs in design and implementation .

Modern computer architectures designed with high-performance microprocessors offer

tremendous potential gains in performance over previous designs. Yet their very complexity makes it increasingly difficult to produce efficient code and to realize their full potential. This landmark text from two leaders in the field focuses on the pivotal role that compilers can play in addressing this critical issue. The basis for all the methods presented in this book is data dependence, a fundamental compiler analysis tool for optimizing programs on high-performance microprocessors and parallel architectures. It enables compiler designers to write compilers that automatically

transform simple, sequential programs into forms that can exploit special features of these modern architectures. The text provides a broad introduction to data dependence, to the many transformation strategies it supports, and to its applications to important optimization problems such as parallelization, compiler memory hierarchy management, and instruction scheduling. The authors demonstrate the importance and wide applicability of dependence-based compiler optimizations and give the compiler writer the basics needed to understand and implement them. They also offer cookbook explanations

for transforming applications by hand to computational scientists and engineers who are driven to obtain the best possible performance of their complex applications. The approaches presented are based on research conducted over the past two decades, emphasizing the strategies implemented in research prototypes at Rice University and in several associated commercial systems. Randy Allen and Ken Kennedy have provided an indispensable resource for researchers, practicing professionals, and graduate students engaged in designing and optimizing compilers for modern computer architectures.

* Offers a guide to the simple, practical algorithms and approaches that are most effective in real-world, high-performance microprocessor and parallel systems. *

Demonstrates each transformation in worked examples. *

Examines how two case study compilers implement the theories and practices described in each chapter. *

Presents the most complete treatment of memory hierarchy issues of any compiler text. *

Illustrates ordering relationships with dependence graphs throughout the book. *

Applies the techniques to a variety of languages, including Fortran 77, C, hardware

definition languages, Fortran 90, and High Performance Fortran. * Provides extensive references to the most sophisticated algorithms known in research.

The Mexican International Conference on Artificial Intelligence (MICAI) is aimed at promoting research in artificial intelligence (AI) and cooperation among Mexican researchers and their peers worldwide. MICAI is organized by the Mexican Society for Artificial Intelligence (SMIA) in collaboration with the American Association for Artificial Intelligence (AAAI). After the

success of the three previous biannual conferences, we are pleased to announce that MICAI conferences are now annual, and we present the proceedings of the 4th Mexican International Conference on Artificial Intelligence, MICAI 2005, held on November 14–18, 2005, in Monterrey, Mexico. This volume contains the papers included in the main conference program, which was complemented by tutorials, workshops, and poster sessions, published in supplementary proceedings. The proceedings of past MICAI conferences were also published in Springer's Lecture Notes in Artificial Intelligence (LNAI) series, vols. 1793, 2313, and 2972.

Compilers: Principles, Techniques and Tools, is known to professors, students, and developers worldwide as the "Dragon Book," . Every chapter has been revised to reflect developments in software engineering, programming languages, and computer architecture that have occurred since 1986, when the last edition published. The authors, recognising that few readers will ever go on to construct a compiler, retain their focus on the broader set of problems faced in software design and software development. Designed for an introductory course, this text encapsulates the topics essential for a freshman course on compilers. The book provides a balanced coverage of both theoretical and practical aspects. The text helps the readers understand the process of compilation and proceeds to explain the design and construction of compilers in detail. The concepts are supported by a good number of compelling examples and exercises.

The author starts with the premise that C is an excellent language for software engineering projects. The book con-
