Harmful algae on tropical coral reefs: Bottom-up ...

Harmful Algal Blooms ... and Coral Reefs? Harmful algal blooms can cause numerous problems in the environment. The US EPA describes algae blooms as overgrowths of algae in the water, which can be caused when nutrient pollution (nitrogen and phosphorus) in the water fuels algal growth. Harmful algal blooms can be harmful to aquatic life, as some produce toxins that can make animals sick, while others can die off in large quantities and deplete oxygen in the water when they decompose.

Are Harmful Algal Blooms a New Concern For Coral Reefs ...

Algal Blooms can have serious effects on corals. Red algae, brown algae, and green algae are a few examples of macro-algae that can have a very negative effect on corals. They do this by outcompeting, overgrowing and eventually replacing sea-grasses and coral reef habitats. According to some research that is being done, harmful tropical algal blooms are increasing in frequency and intensity.

Harmful Algal Blooms – A Student's Guide to Tropical ...

Diatom algae are not generally harmful to fish but can be harmful to live plants and coral. Some species do what is called " encrusting, " which means they will grow on the outside of the plant or coral and create a crust that blocks their host from getting food and respiration.

How To Get Rid Of Diatom Blooms - Aquarium Gear

Turf algae are becoming more abundant on coral reefs worldwide, but their effects on other benthic organisms remain poorly described. To describe the general characteristics of competitive interactions between corals and turf algae, we determined the occurrence and outcomes of coral – turf algal interactions among different coral growth forms (branching, upright, massive, encrusting, plating ...
