II Basic Concepts. Space plasma physics often requires that dynamics be analyzed in terms of both the motion of individual particle and in terms of macroscopic moments such as temperature T, density n, and pressure P. Individual particle motion is based on considering the force $F = q (E + v \times B)$ acting on a particle of charge q, mass m, and moving with a velocity v in an electric field E and magnetic field B. Particle motion is generally separated into components v parallel to B and v

Plasma Physics - an overview | ScienceDirect Topics

Plasma Physics. We are generally interested in the science and applications of the ionized gases that are often called Technological Plasmas. Such plasmas have applications as diverse as light sources, large display televisions, medical instruments, and a variety of material processing systems. From both scientific and technological viewpoints, a key feature of the plasmas that we study are that they are far from thermodynamic equilibrium, which means that the atoms and molecules in the ...
