The lateral line in bony fishes is composed of a series of receptor organs called neuromasts, which are located on the epithelium or in lateral line canals on the head and trunk, and are innervated by several lateral line nerves, which project to the hindbrain. Neuromast receptor organs are epithelial structures composed of a population of sensory hair

The mechanosensory lateral line sense organ is unique to aquatic vertebrates (fishes and the amphibians) (Dijkgraaf 1963). The lateral line consists of surface neuromasts located on the skin ' s surface that detect slow moving water and canal neuromasts that are embedded in the lateral line canals and sense rapidly moving water (Northcutt

Surface wave detection by animals is the process by which animals, such as surface-feeding fish are able to sense and localize prey and other objects on the surface of a body of water by analyzing features of the ripples generated by objects' movement at the surface. Features analyzed include waveform properties such as frequency,

based rheotaxis in ...

The lateral line system is a sensory system found in fishes and aquatic amphibians.

With the lateral line system, fishes measure the relative movements between their body and the surrounding water at each of up to several thousand sensory organs, the neuromasts (Dijkgraaf, 1952, 1963).
